

Relational Algebra and SQL

2.4 and 6.1.

Recall:

Relational Algebra (RA)

• Operations on Relations.

Projection

$\pi_{\langle \text{List Expr} \rangle} R$

list of expressions on the attributes of a relation.

Ex. $R(a,b)$

a	b
1	9
3	3

① $\pi_a R$

a
1
3

② $\pi_{a+s, -b} R$

a+s	-b
6	-9
8	-3

name of attributes

③ $\pi_{b,a} R$

b	a
9	1
3	3

④ $\pi_{-1,a} R$

"-1"	a
-1	1
-1	3

SQL:

select <list expr> from R

① SELECT a FROM R

② SELECT a+5, -b FROM R

③ SELECT b, a FROM R

④ SELECT -1, a FROM R

Name of Relation optional!!

SELECT 3;

3
3

 Creates table of

one tuple!!

SELECT 'abc', 5.2

=>

abc	5.2
'abc'	5.2

name of
attribute.

Tupler.

The result of SELECT is always a relation

Renaming Relations and their attributes.

Sometimes we need to rename tables or their attributes.

$\rho_{\langle \text{new schema} \rangle} R$

Ex:

$R(a,b)$ $\rho_{S(c,d)} R$
renames $R(a,b)$ to
 $S(c,d)$

dmg notation: you can rename during the projection.

If we want to rename the projected expression we can do it:

$\pi_{a \rightarrow c, b \rightarrow d} R \rightarrow S$
Result schema $S(c,d)$

Ex: ① $\Pi_{a+s \rightarrow x, -b \rightarrow y} R$

x	y
6	-9
8	-3

SQL.

Given $R(a,b)$ $\rho_{S(c,d)} R$

SELECT a, b FROM R as S(c, d)

or

SELECT a as c, b as d FROM R

①

SELECT a + 5 AS x, -b AS y FROM R

FULL $\left\{ \begin{array}{l} \text{NATURAL JOIN} \quad R \bowtie S \\ \text{THETA JOIN} \quad R \bowtie_P S \end{array} \right.$

- Compute non-full join
- Add tuples in R not in join padded with NULL
- Add tuple in S not in join padded with NULL

$\therefore R(a,b)$

a	b
3	x
1	y

 $S(a,c)$

a	c
2	3.1
5	2.5

$R \bowtie S$

a	b	c
1	y	2.5
3	x	<u>1</u>
5	<u>1</u>	3.1

← Represents NULL in RA

SELECT * FROM R NATURAL FULL JOIN S

$R \bowtie_{R.a > S.a} S$

R.a	b	S.a	c
3	x	2	3.1
1	y	<u>1</u>	<u>1</u>
<u>1</u>	<u>1</u>	5	2.5

SELECT * FROM R FULL JOIN S
ON (R.a > S.a)

Theta Join

$$R \bowtie_P S = \sigma_P (R \times S)$$

Cross Product X

$$R \times S$$

SQL

SELECT * FROM R, S;

NATURAL JOIN

$$R \bowtie S$$

SQL:

SELECT * FROM R NATURAL JOIN S

Theta Join

$$R \bowtie_P S = \sigma_P (R \times S)$$

SQL:

SELECT * FROM

R JOIN S ON (P);

SELECTION

$$\sigma_P R$$

P is a predicate on attributes of R

Expressions:

<, >, <=, =, >=, <=

different equal

AND, NOT and many others.

Ex:

	a	b
R(a,b)	3	2
	1	Ø

p evaluated at each tuple.

$$\textcircled{1} \sigma_{a>1 \text{ OR } b>1} R$$

a	b
3	2

SQL:

SELECT * FROM R WHERE p

original attributes of R

Ex:

① SELECT * FROM R
WHERE $a > 1$ OR $b > 1$

We can combine Π and σ :

Ex: $\Pi_a \sigma_{a > 1 \text{ OR } b > 1} R$

SELECT a FROM R
WHERE $a > 1$ OR $b > 1$

NOT equivalent to.

$\sigma_{a > 1 \text{ OR } b > 1} \Pi_a R$

b is not part of $\Pi_a R$.

Questions

What does this return?

1) $\sigma_{\text{FALSE}} R$

2) $\sigma_{\text{TRUE}} R$

Ex:

R(a,b)

a	b
1	x
2	y

S(a,c)

a	c
5	8
2	12

Common attributes = {a}

$T = R \bowtie S = \Pi_{a,b,c} \sigma_{R.a=S.a} (R \times S)$

R x S

R.a	R.b	S.a	S.c
1	x	5	8
1	x	2	12
2	y	5	8
2	y	2	12

} $R.a = S.a$

$R \bowtie S$

a	b	c
2	y	12

Natural Join \bowtie

Given relations R and S

C is set of attributes of both S and R
with the same name

• if C is empty.

$$R \bowtie S = R \times S$$

• otherwise

$$\pi_{\text{Attr}(R), \text{Attr}(S) - C} \left(\sigma_{\bigwedge_{a_i \in C} R_{a_i} = S_{a_i}} (R \times S) \right)$$

Do not project
both common
attributes (only
the first).

match tuples
with same value in
common attributes.
conjunction over
all common attributes

Other expressions in predicates.

IN

att IN (List)

Ex.

$$a \text{ IN } (3, 2, 5)$$

\Rightarrow equivalent to $(a = 3 \text{ or } a = 2 \text{ or } a = 5)$

But we can also use a query:

$$a \text{ in } (\pi_C S)$$

SQL:

$$a \text{ IN } (\text{SELECT } C \text{ FROM } S)$$

EXISTS

EXISTS (R) true if R not empty

Ex:

$$\text{EXISTS } (\sigma_{\text{ass}} R)$$

Operations on 2 Relations.

Union \cup

Intersection \cap

Difference (Exapt) $-$

Union Compatible

R and S are "union compatible" iff
 $|attrs(R)| = |attrs(S)|$

and the type of the i -th attribute of S is **type compatible** with the type of the i -th attribute of R .

One type t_1 is type compatible with type t_2 if t_1 can be converted to type t_2 .

$A \cup B$
 $A \cap B$
 $A - B$

} Defined only iff
 A & B are
union compatible.

Cross product: \times

Given relations R and S .

$(r, t) \in R \times S$ iff $r \in R$ and $s \in S$

$R(a, b)$

a	b
1	x
2	y

$S(c, d)$

c	d
5	8
2	12

$T = R \times S$

a	b	c	d
1	x	5	8
1	x	2	12
2	y	5	8
2	y	2	12

What is schema of T ?

Ex:

$\text{NULL} > 5 \Rightarrow \text{UNKNOWN}$

$x \text{ is NULL} \Rightarrow \text{True if } x \text{ contains NULL}$

UNKNOWN is NOT TRUE

Ex:

UNKNOWN OR TRUE \Rightarrow TRUE

UNKNOWN AND TRUE \Rightarrow FALSE
See exercise !!

Text Matching.

Regular expressions. (Postgres)

$\text{expr} \sim \text{RegExp}$

Ex

$a \sim '^ab'$

attribute a starts with string ab

$a \sim '\backslash.txt\$'$

attribute a end with string .txt

UNION

$t \in R \cup S \Leftrightarrow t \in R \text{ and } t \in S$

$t \in R \cap S \Leftrightarrow t \in R \text{ or } t \in S$

$t \in R - S \Leftrightarrow t \in R \text{ and } t \notin S$

Schema of result is schema of first relation.

Ex:

Ex:

a

b

1

a

3

x

R (a,b)

S(c,d)

c

d

1

e

3

x

4

f

$R \cup S$	<table><tr><th>a</th><th>b</th></tr><tr><td>1</td><td>a</td></tr><tr><td>3</td><td>x</td></tr><tr><td>1</td><td>e</td></tr><tr><td>4</td><td>f</td></tr></table>	a	b	1	a	3	x	1	e	4	f
a	b										
1	a										
3	x										
1	e										
4	f										

$R \cap S$	<table><tr><th>a</th><th>b</th></tr><tr><td>3</td><td>x</td></tr></table>	a	b	3	x
a	b				
3	x				

$R - S$	<table><tr><th>a</th><th>b</th></tr><tr><td>1</td><td>a</td></tr></table>	a	b	1	a		
a	b						
1	a						
$S - R$	<table><tr><th>c</th><th>d</th></tr><tr><td>1</td><td>e</td></tr><tr><td>4</td><td>f</td></tr></table>	c	d	1	e	4	f
c	d						
1	e						
4	f						

SQL

TABLE R { UNION
INTERSECT
EXCEPT } TABLE S

or

<QUERY> { UNION
INTERSECT
EXCEPT } <QUERY>

SELECT a, b FROM R

UNION

SELECT c, d FROM S;

NULLS (6.1)

SQL has a special value: NULL
⇒ unknown.

Example:

- Next year champion of the Stanley Cup.
- Grades of students currently enrolled in this course.
- SQL has special considerations for expressions involving NULL
- SQL Logic 3 valued:
 - True
 - False
 - Unknown
- Any expression involving NULL results into UNKNOWN

IMPORTANT

$$\left. \begin{array}{l} X = \text{NULL} \\ X > \text{NULL} \end{array} \right\} \Rightarrow \text{UNKNOWN.}$$

To test if attr is NULL use
$$X \text{ IS NULL}$$
